

PRODUCT INFORMATION SHEET

Kodak Goldstar Premium Developer system

Introduction

Kodak Goldstar Premium plate developer is designed for use with the Electra HRL range of thermal CTP plates.

The Goldstar chemistry system comprises two products:

Goldstar Premium developer
Goldstar Premium developer replenisher

Goldstar Premium developer

This is a ready-to-use positive working developer designed to act as both a developer starter and its own replenisher.

Replenishment rates will be set for both chemical exhaustion and for aerial oxidation.

Rates for exhaustion will be between 60 – 85 ml/m² and 85 ml/hr for anti-oxidation.

Goldstar Premium developer rejuvenation

For increased economy and reduced production of waste chemical, the rejuvenation system operates with the use of Goldstar Premium Developer Replenisher.

On start-up, the plate processor is chemicalised with Goldstar Premium Developer. The replenishment and anti-ox systems are set up to use Premium Developer Replenisher. Replenishment rates are the same as for the use of Goldstar developer.

The effect of using Developer Replenisher is to prolong the life of the developer and generally to double the length of time between changing and draining the chemical bath of the processor.
